PYTHON FULLSTACK PROJECT

OBJECTIVE

- The main objective of this project is to help users track their daily and emotional well-being in a simple and secure way.
- The system aims to provide a personal digital journal for recording thoughts and feelings.
- The application helps users improve self-awareness by showing mood history and emotional patterns.

INTRODUCTION

- Mental Health Companion is a web-based application that helps user track their daily mood and emotional well-being in a simple and secure way.
- The application allows users to record personal thoughts through a digital journal and view their mood history.
- This project is developed as a Python Full Stack application to support emotional awareness and healthy mental habits.

PROBLEM STATEMENT

- Many people are unable to consistently monitor their emotional health due to busy routines and lack of awareness.
- There is no simple and secure platform to record daily feelings and personal thoughts in one place.
- Early signs of stress and emotional imbalance often go unnoticed without regular self-reflection tools.

SYSTEM FEATURES

- Secure user registration and login system to protect personal data.
- Daily mood tracking feature to record emotional state.
- Journal entry feature to write personal thoughts and experiences.
- Mood history and dashboard to view previous records.
- Simple and user-friendly interface for easy usage.

TECHNOLOGY STACK

- Frontend technologies include HTML, CSS and JavaScript for building responsive user interfaces.
- Backend technologies include Python, Django and Django REST Framework for server-side processing.
- SQLite database is used for storing user accounts, mood records and journal information.
- Git and Visual Studio Code are used for development and team collaboration.

FRONTEND MODULE

- The frontend provides a clean and calming interface suitable for mental-health related applications.
- Users can easily submit moods and journal entries using interactive forms.
- Dashboard screens help users review previous records in a simple and clear manner.

BACKEND MODULE

- The backend is developed using Python and Django to handle application logic.
- Django REST Framework is used to create APIs for frontend communication.
- Authentication and authorization ensure that only valid users access their personal data.
- All mood and journal data are securely stored in the database.

SYSTEM ARCHITECTURE

- The user accesses the application through a web browser.
- The frontend communicates with the backend using REST APIs.
- The backend processes user requests and interacts with the database.
- The overall system follows a client–server architecture model.

FUTURE ENHANCEMENTS

- AI based mood analysis can be introduced to provide personalized emotional insights and suggestions.
- A chatbot feature can be integrated to support users with basic emotional guidance.
- Mobile application support can be added to improve accessibility and daily usage.

CONCLUSION

- The Mental Health Companion application promotes regular emotional awareness among users.
- It supports users in building healthy mental habits through daily self-reflection.
- This project demonstrates a complete real-world Python full stack web application.

THANK YOU
